The CHUM - (Cross Hole Ultrasonic Monitor) uses the Cross-hole Sonic Logging (CSL) method to perform *high-resolution* quality control of deep foundations.

The system uses an ultrasonic wave sent from a transmitter to a receiver pulled through water-filled access tubes embedded in the concrete. The measured arrival time and energy are strongly dependent on the concrete quality. [[overview of this test method](#)]. Additional methods supported by the CHUM are [Single Hole Ultrasonic Testing](#) and [Tomography](#) (two and three-dimensional).

The CHUM is fully compliant with [ASTM D6760-16](#)
